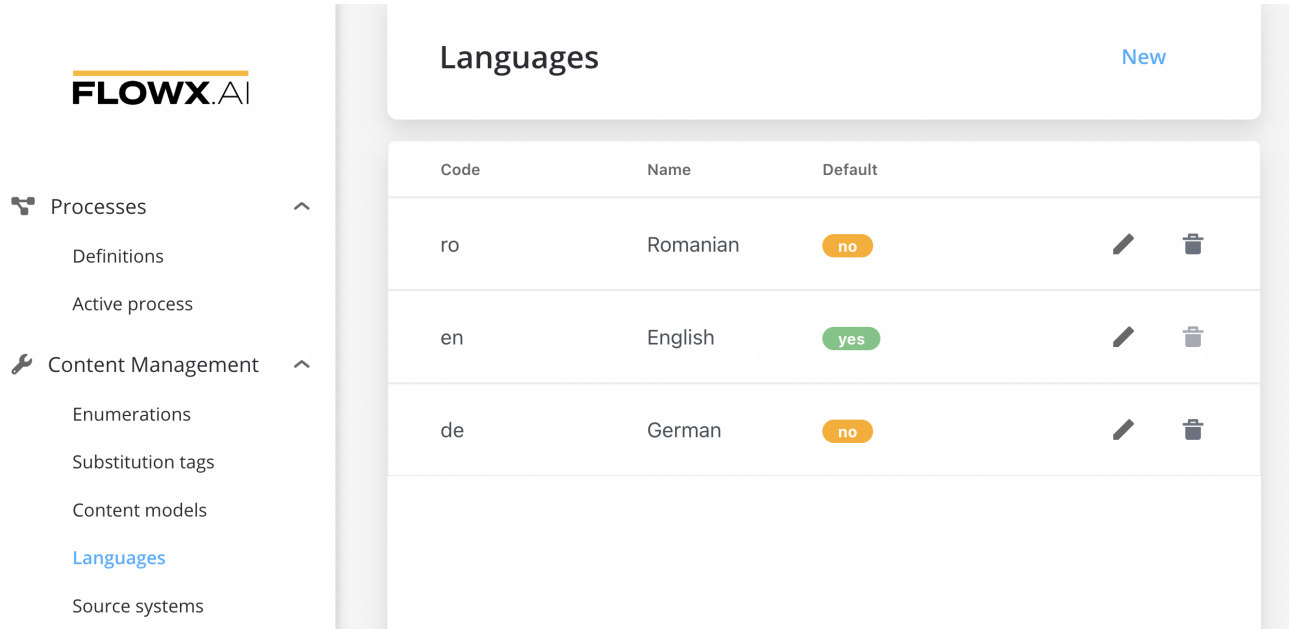
PLATFORM DEEP DIVE / Core components / Core extensions / Content management / Languages

The FLOWX Headless CMS can store and manage languages. You can add a language and use it in almost any content management configuration.

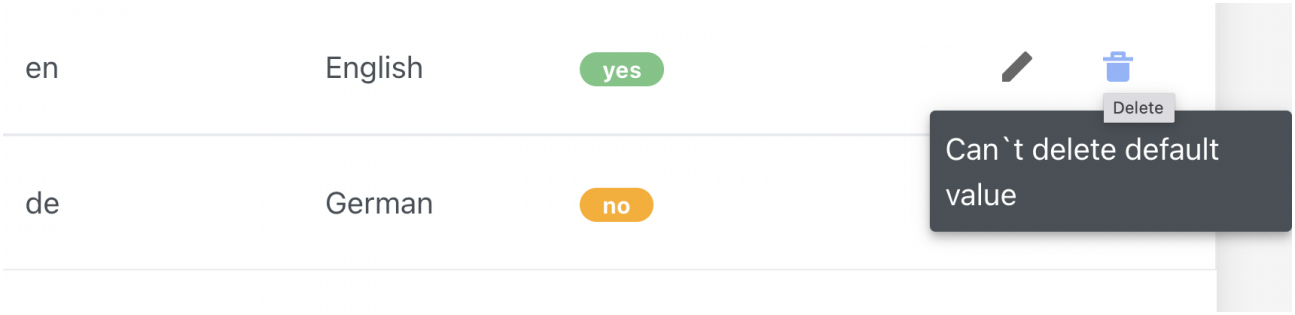


On the main screen inside **Languages**, you have the following elements:

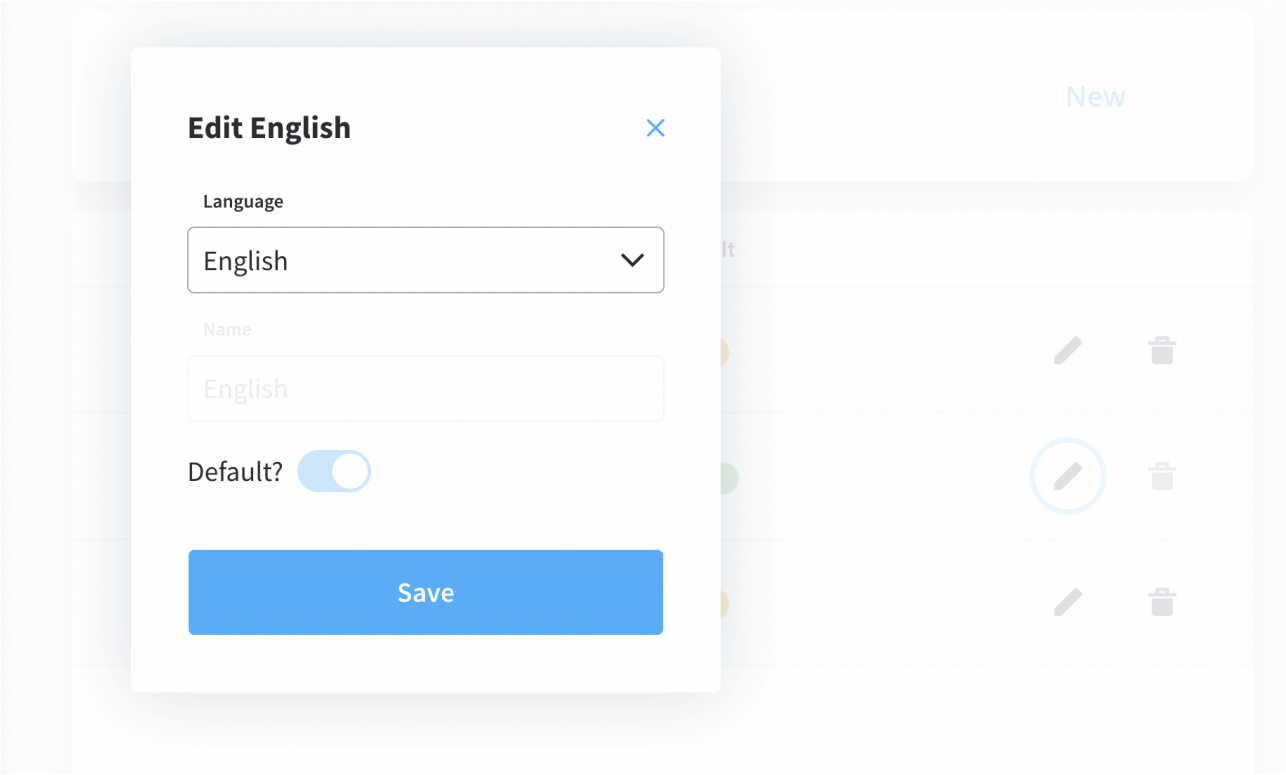
- **Code** - not displayed in the end-user interface, but used to assure value uniqueness

- **Name** - the name of the language
- **Default** - you can set a language as **Default** (default values can't be deleted)

> **CAUTION**
>
> When working with substitution tags or other elements that imply values from other languages defined in the CMS, when running a process, the default values extracted will be the ones marked by the default language.



- **Edit** - button used to edit a language



- **Delete** - button used to delete a language

> **DANGER**
>
> Before deleting a language make sure that this is not used in any content management configuration.

- **New** - button used to add a new language

Adding a new language

To add a new language, follow the next steps:

1. Go to
   The fallback content to display on prerendering

and select the **Content Management** tab.

2. Select **Languages** from the list.
3. Choose a new **language** from the list.
4. Click **Add** after you finish.
