PLATFORM DEEP DIVE / Integrations / Creating a Kafka consumer

TIP

This guide focuses on creating a

The fallback content to display on prerendering consumer using Spring Boot.

Here are some tips, including the required configurations and code samples, to help you implement a Kafka consumer in Java.

Required dependencies

Ensure that you have the following dependencies in your project:

```
<dependency>
  <groupId>org.springframework.kafka</groupId>
  <artifactId>spring-kafka</artifactId>
</dependency>
```

```
<dependency>
  <groupId>io.strimzi</groupId>
  <artifactId>kafka-oauth-client</artifactId>
  <version>0.6.1</version>
</dependency>

<dependency>
  <groupId>org.apache.kafka</groupId>
  <artifactId>kafka-clients</artifactId>
  <version>2.5.1</version>
</dependency>

<dependency>
  <groupId>io.opentracing.contrib</groupId>
  <artifactId>opentracing-kafka-client</artifactId>
  <version>0.1.13</version>
</dependency>
```

Configuration

Ensure that you have the following configuration in your `application.yml` or `application.properties` file:

```
spring.kafka:
  bootstrap-servers: URL_OF_THE_KAFKA_SERVER
  consumer:
    group-id: ADD_CONSUMER_NAME
    auto-offset-reset: earliest
    key-deserializer:
org.apache.kafka.common.serialization.StringDeserializer
    value-deserializer:
org.apache.kafka.common.serialization.StringDeserializer
```

```
        properties:
          interceptor:
            classes:
io.opentracing.contrib.kafka.TracingConsumerInterceptor
          security.protocol: "SASL_PLAINTEXT"
          sasl.mechanism: "OAUTHBEARER"
          sasl.jaas.config:
"org.apache.kafka.common.security.oauthbearer.OAuthBearerLogin
required ;"
          sasl.login.callback.handler.class:
io.strimzi.kafka.oauth.client.JaasClientOAuthLoginCallbackHand

kafka:
  consumerThreads: 1
  authorizationExceptionRetryInterval: 10
  ADD_NEEDED_TOPIC_NAMES_HERE
```

Code sample for a Kafka Listener

Here's an example of a Kafka listener method:

```
@KafkaListener(topics = "TOPIC_NAME_HERE")
public void listen(ConsumerRecord<String, String> record)
throws JsonProcessingException {

    SomeDTO request = objectMapper.readValue(record.value(),
SomeDTO.class);

    // process received DTO
}
```

Make sure to replace "TOPIC_NAME_HERE" with the actual name of the Kafka topic you want to consume from. Additionally, ensure that you have the necessary serialization and deserialization logic based on your specific use case.
