BUILDING BLOCKS / Actions / Business Rule action / DMN Business Rule action

For a brief introduction to

The fallback content to display on prerendering , check the following section:

» Intro to DMN

Creating a DMN Business Rule action

To create and attach a DMN

The fallback content to display on prerendering action to a task

The fallback content to display on prerendering , you must do the following:

1. Open

The fallback content to display on prerendering

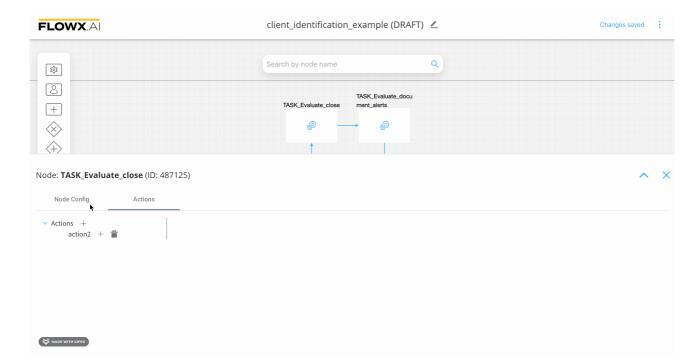

and go to

The fallback content to display on prerendering

.

- 2. Select your process from the list and click **Edit process**.
- 3. Select a **task node** then click the **edit button** (the key icon) this will open the node configuration menu.
- 4. In the opened menu, go to the The fallback content to display on prerendering tab then click the "+" button.
- 5. From the dropdown menu choose the action type Business Rule.
- 6. In the Language dropdown menu, select DMN.

Using a DMN Business Rule action

We have the following scenario, a bank needs to perform client identification tasks/actions. This action can be defined as a

The fallback content to display on prerendering inside a

The fallback content to display on prerendering process using

The fallback content to display on prerendering

.

A business person or specialist can use DMN to design this business rule, without having to go deep into technical definitions.

Here is an example of an MVEL script - defined as a business rule action inside a Service Task node:

```
closedClientType = ["PF_CLOSED", "PF_SPECIAL", "PF_ABC",
   "PJ_CLOSED"];
clientType =
input.get("application").get("client").get("clientType");
if (closedClientType.contains(clientType)) {
    alertTitle = "Customer no longer with the bank";
    alertDescription = "Hey! This person was a client
before. For a new account modify the CIF.";
    output.put("applications", {"client": {"alertTitle":
    alertTitle, "alertDescription": alertDescription}});
}
```

The previous example could be easily transformed into a DMN Business Rule action - represented by the decision table:

| Decision table Hit Policy: Unique ~ | | | | |
|---------------------------------------|---|-----------------------------------|---|-------------|
| | When | ii . | And | |
| | application.client.clientType | alert_title | alert_description | Annotations |
| | string | string | string | |
| 1 | IN ("PF_CLOSED", "PF_SPECIAL", "PF_ABC", "PJ_CLOSED") | Customer no longer with the bank. | Hey! This person was a client before. For a new account, modify the CIF | |
| 2 | - | | | |
| + | - | | | |

In the example above we used FEEL expression language in order to write the rules that should be met in order for the output to happen. FEEL defines a syntax for expressing conditions that input data should be evaluated against.

Input - In the example above we used as inputs the type of clients (inside a bank)
using the application.client key

Output - In the example above we used as inputs the type of clients (inside a bank) using the application client key

DMN also defines an XML schema that allows DMN models to be used across multiple DMN authoring platforms. The following output is the XML source of the decision table example from the previous section:

```
<input id="input 1"</pre>
label="application.client.clientType" biodi:width="277">
        <inputExpression id="inputExpression_1"</pre>
typeRef="string">
          <text></text>
        </inputExpression>
      </input>
      <output id="output_1" label="alert_title"</pre>
typeRef="string" />
      <output id="OutputClause 043h9fw"</pre>
label="alert_description" typeRef="string" />
      <rul>< rule id="DecisionRule 10bh1zx">
        <inputEntry id="UnaryTests 0a6rf6l">
          <text>IN ("PF_CLOSED", "PF_SPECIAL", "PF_ABC",
"PJ CLOSED")</text>
        </inputEntry>
        <outputEntry id="LiteralExpression_0xszo8x">
          <text>Customer no longer with the bank.</text>
        </outputEntry>
        <outputEntry id="LiteralExpression 0l2bioo">
          <text>Hey! This person was a client before. For a
new account, modify the CIF</text>
        </outputEntry>
      </rule>
      <rule id="DecisionRule 1jj1rv2">
        <inputEntry id="UnaryTests_0cf2e91">
          <text></text>
        </inputEntry>
        <outputEntry id="LiteralExpression 1b9jkr4">
          <text></text>
        </outputEntry>
        <outputEntry id="LiteralExpression 12hua2f">
          <text></text>
        </outputEntry>
      </rule>
```

```
</decisionTable>
</decision>
</definitions>
```

You can use this XML example with FLOWX Designer, adding it to a Business Rule Action - using an MVEL script. Then you can switch to DMN if you need to generate a graphical representation of the model.
